

Section 4 Cheat Sheet

Digital Pin Modes

Digital Pin: INPUT Mode	Code:	<code>pinMode(myPin, INPUT);</code> <code>pinMode(myPin, INPUT_PULLUP);</code> <code>digitalRead(myPin);</code>
	Used for:	<ul style="list-style-type: none"> Receiving information (0 or 1)
Digital Pin: OUTPUT Mode	Code:	<code>pinMode(myPin, OUTPUT);</code> <code>digitalWrite(myPin, HIGH);</code> <code>digitalWrite(myPin, LOW);</code> <code>analogWrite(myPin, #);</code> (# is an integer from 0-255, 0=0% duty cycle, or LOW 127=50% duty cycle, or HIGH half the time 255=100% duty cycle, or HIGH all the time)
	Used for:	<ul style="list-style-type: none"> Sending information (0 or 1) Powering low-power devices (<0.2 W) Serial communications (e.g. I²C) PWM (Pulse-Width Modulation), pins 3,9,10,11: 490 Hz, pins 5,6: 980 Hz.

Pull-up and Pull-Down Resistor:

Converting an analog reading:

```
//to a float:
float volts=analogRead(myPin)*5.0/1023.0;
//to PWM range 0-255:
byte x=analogRead(myPin)/4;
//to new int range (ymin to ymax):
int reading=analogRead(myPin);
int y=map(reading,0,1023,ymin,ymax);
```

Serial Monitor

```
Serial.begin(9600); //start monitor
Serial.print("Hello");
Serial.println("Hello"); //new line after
Serial.println(reading,4); //with 4 decimals
```

Analog Pin Modes

Analog Pin, INPUT Mode	Code:	<ul style="list-style-type: none"> No need to declare <code>pinMode()</code> <code>analogRead(myAnalogPin);</code> To use the internal 1.1V analog reference: <code>analogReference(INTERNAL);</code> To use an external analog reference: <code>analogReference(EXTERNAL);</code> Remember to plug a voltage into the AREF pin to use an external analog reference. <code>pinMode(myPin, INPUT_PULLUP);</code> //optional
	Used for:	<ul style="list-style-type: none"> Receiving a voltage. (0→1023, maps to 0→5V, or 0→AREF)
Analog Pin, OUTPUT Mode	Code:	<code>pinMode(myAnalogPin, OUTPUT);</code> <code>digitalWrite(myPin, HIGH);</code> <code>digitalWrite(myPin, LOW);</code>
	Used for:	<ul style="list-style-type: none"> Same as digital pin in OUTPUT mode (you can use analog pins if you run out of digital pins). Not PWM-capable.

void function with no parameters:

```
void doSomething1(){
    actions in here; //nothing returned
}
```

void function with parameters:

```
void doSomething2(byte x, int y){
    //local copies made of x and y
    actions in here; //nothing returned
}
```

int function with parameters:

```
int calcSomething1(byte x, int y){
    actions in here;
}
```

float function with parameters:

```
float calcSomething2(byte x, int y){
    actions in here;
    return answer; //return this float
}
```

To call the functions above:

```
doSomething1();
doSomething2(3,5);
int answer1=calcSomething1(5,6);
float answer2=calcSomething2(4,7);
```

Call-by-Value

```
void myFn1(int y){
    //local copy made of y arg
    y++; //increase copy of y
    //by 1
}
```

Call-by-Reference

```
void myFn2(int &y){
    //y arg address passed
    y++; //increase y by 1
}
```

To call the functions above:

```
int x=6;
myFn1(x); //after fn, x=6
myFn2(x); //after fn, x=7
```

#define Statements

```
#define MYPIN 6 //no ; here
#ifdef MYPIN
    do something here;
#else
    do something else;
#endif
// as function:
#define CUBE(x) (x*x*x)
float y=CUBE(3); //y=27
```
